#### Disclaimer of liability

The present manual was compiled with utmost care, errors and omissions reserved. For this reason Baumer Germany GmbH & Co. KG rejects any liability for the information compiled in the present manual. Baumer Germany GmbH & Co. KG nor the author will accept any liability for direct or indirect damages resulting from the use of the present information.

At any time we should be pleased receiving your comments and proposals for further improvement of the present document.

# 1 Symbols used

The note at the right of the symbol must be observed in all cases.

The following path and file details refer to a hard disk (use the correct drive letter).

Button Symbol for the corresponding button or key in the user interface.

*low* Italic text, used here for the voltage level of a switched output (only for DSL. **R**).

*bold* Bold italic text, used here for the file paths and file names.

## 2 Device versions

The DSL is a speed switch that is integrated into an incremental encoder. At the time of writing (edition: October 2014) it is supplied in two versions:

Version 1: DSL.R suitable for operation with the external relay module DS 93 R.

- Version with 3 switched outputs that can be switched according to the speed. If the device is at standstill or the rotational speed n is less than the switching speed  $n_{s(off)}$  then the corresponding switched output will be *high*. If  $n \ge n_{s(on)}$  then it will be *low*.
- If an internal error occurs (for instance, dirt on the disk, so that the counted pulse rate is incorrect) then the outputs will switch to *low*.

Version 2: DSL.E with three internal electronic relays (not available in combination with HOG 86).

- Integrated current monitoring for each relay: This checks whether, when the relay is closed, a current of at least 5 mA flows through the switched circuit.
- Two relay outputs (R1, R2) are switched according to the speed. If the device is at standstill or  $n < n_{s(off)}$  then the corresponding relay is closed. If  $n \ge n_{s(on)}$  then it will be open.
- The third relay output (C1) is a check output. If no current flows through at least one of the switched circuits of the relay outputs (R1, R2), although the relay is closed, then the check output (C1) will be opened.
- If no current flows through the switched circuit of the check relay (C1), although the relay is closed, then R1 and R2 will be opened.
- If an internal error occurs (for instance, dirt on the disk, so that the counted pulse rate is incorrect) then all relays will be opened

#### **3** System requirements

PC with - operating system Windows 7 or Windows 10

- USB connection
- at least 1 GB available on the hard disk.

The DSL is fitted with an RS 485 interface. Data exchange with the PC requires an RS 485 converter ("USB to RS 485" or "RS 232 to RS 485"). A "USB to RS 485" converter can be obtained from Baumer Germany GmbH & Co. KG (Order code: USB 485-Converter).

# 4 Installation

Graphical user interface and manual are available as download in the Internet at www.baumer.com.

After the download start *volume/setup.exe*. This will install the program and the runtime library. The installation language is only available in english.

After starting the setup program, the following screens will appear (Figure 1 to 4):

🐙 Setup — 🗆 🗙	🐙 Setup — 🗆 🗙

Figure 5: End of installation

Figure 6: Restart

A restart is necessary.

Start the program after a standard installation with

#### Start $\Rightarrow$ DSL Speed Switch GUI $\Rightarrow$ DSL Speed Switch GUI

# 5 First program start

<u>Before</u> the program start the RS485-Converter has to be connected otherwise the serial interface used by the converter will not appear in the overview of all usable serial interfaces.

The first time the program is started, a selection screen will appear where you can choose the language for the user interface and the system interface (Figure 7). The software version of the user interface is displayed in the header of this window.

You can use <u>Close program</u> to terminate the software at any time. Parameter changes that have not been saved will be lost.

#### 5.1 Language setting

numer DSI: Speed Switch GUI V1.0.3	
BaumerHübner	Motion Contro
try to connect DSL	
choose a COM port	
waiting for input	
Sprachauswahl /	
Sprachauswahl / Choose your language english	

Figure 7: Start screen

Clicking on the national flag will call up a selection of languages that have been implemented for the user interface. The required language can be selected by clicking on the appropriate national flag.

#### 5.2 Interface

To establish a connection with the DSL, the serial interface (to which the RS 485 converter is connected) must be set up in the selection field (Figure 8).

Baumer DSL Speed Switch GUI V1.0.3	- 🗆 X
BaumerHübner	Motion Control
try to connect DSL	
<ul> <li>choose a COM port</li> <li>auto-scan of all COM ports</li> <li>COM1</li> <li>COM3</li> </ul>	
Sprachauswahl / Choose your language	
english	close program

Figure 8: COM port selection

The Auto-Scan function can be used in following cases:

- 1. If the RS485-Converter was connected after the program start and the serial interface does not appear in the overview
- 2. If the serial interface is not known

This transmits an identification to every serial interface (COM1 to 8) and waits for a response telegram from the attached DSL.

Because of insufficient implementation of virtual serial interface driver (e.g. bluetooth) problems can appear during the Auto-Scan. In that case please choose the serial interface manually.

If other devices are connected to the individual serial interfaces, then it cannot be ruled out that they may interpret the transmitted ID as a message directed to them.

If a serial interface is discovered that has a DSL attached, then this will be indicated (Figure 9).

Gr	×
	use COM6
	ОК

Figure 9: COM port confirmation

#### 5.3 Saving the settings

The language selected and the serial interface that is used are recorded in a configuration file *c:\Users\<user>\AppData\Local\Baumer DSL\DSL Software.ini*. For subsequent program starts, the settings are read out from this file and the start window will not appear again.

To alter the language setting at a later date, the software must be started without a DSL being connected. In this case, the start screen will appear once more.

# 6 User interface

When the DSL has been detected on a serial interface, the parameters will be read out from the internal memory of the device (Figure 10).

Figure 10: Fetching device data

After all the parameters from the DSL have been read out, the complete user interface will appear (Fig. 11).

	device type counts per turn serial number s	Contractor and Contractor
	POG 10 DN 2500 I + DSL.R 2500 123465	0.12
off On	switching speed switching speed off -60,4 0 -56,4 0 -56,4 0 -56,4 0 -56,4 0 -57,4 0 -60,5 n+ switch delay 0 100 ms	outputs R1
off On	switching speed switching speed off on off -350,0 -332,0 -332,0 -332,0 -332,0 -0 -0 -0 -0 -0 -0 -0 -0 -0 -0 -0 -0 -0	R2
off O on	switching speed switching speed off on off on off o	R3 actual spee

Figure 11: User interface

This is divided into three sections:

#### 6.1 Information window

device type	counts per turn	serial number	sw-version	
POG 10 DN 512 I + DSL.R	512	1810665	0.13	

Figure 12: Information window

The data for the connected device are shown in the information window (Figure 12), with the exact type designation, serial number, device software version, number of counts per turn.

Because of the same electronics, the HOG 86 register itself as HOG 10.

If the DSL is protected by a password, then a small padlock symbol will appear in the information window.

If the user is not logged in to the DSL, it will appear red and locked  $\square$ , after log-in it changes to green and unlocked  $\square$ .

After the connected device has been changed, a new log-in is required, even if both devices have the same password.

If an error occurs in the device, the warning symbol *vill* will appear. The reason for the warning can be called up in the register card Messages in the main window, after which the warning can be deleted.

#### 6.2 Status window

 I-output 1 or 2 (appearing at check output C1): there is no current flowing through the circuit of R1 or R2, even though the relay is closed.

Because of the serial data transmission between the device and the PC, there may be a delay before the output states are displayed.

#### 6.3 Main window

The register cards at the bottom of the window can be used to switch between the three main software functions:

Switching speed Speed monitor Messages

#### 6.3.1 Register: Switching speeds

After the device data have been read out, the register <u>Switching speeds</u> appears, in which the parameters that are stored in the DSL can be read out and edited.

Figure 14: "Switching speeds" register for DSL.E

The third output shown in Figure 14 is the check output of the DSL.**E** (described above under 6.2). On a DSL.**R**, a third field for making settings for switching speeds will appear instead (see Figure 11).

The parameters for each output are set up separately. In addition, individual **ON** and **OFF** switching speeds can be set up for clockwise (right-handed) and anti-clockwise (left-handed) rotation, i. e. up to 4 different switching speeds for each output). System requirements impose a minimum hysteresis of 5% or 2 rpm. Furthermore, a switching delay from 0 to 500 msec can be entered for each switched output, in order to be able to ignore very short speed peaks.

- The maximum **OFF** switching speeds that can be entered as parameters are the maximum encoder speeds (see separate data sheet). Higher values will be reset to this maximum value. If an **OFF** switching speed is set to be lower than the corresponding **ON** speed, then the **ON** speed will be corrected to the maximum possible value (the **OFF** switching speed minus the minimum hysteresis).
- The maximum **ON** switching speeds that can be entered as parameters are the minimum speeds as specified in the data sheet for the encoder. If smaller values are entered, these will be reset to the minimum possible value. The maximum value that can be entered as a parameter for the **ON** switching speed is the **OFF** switching speed minus the minimum hysteresis, larger values will be corrected to this maximum value.

An unused input can be de-activated by the sliding switch "Output on/off" that is shown on the left.

On the DSL.**E** version, any unused output (R1, R2, C1) must be de-activated. This is necessary because the current monitoring will detect an error condition if the output switches without any load being connected.

Alterations to parameters are activated by operating the <u>Save parameters</u> button. The altered values will only be written to the DSL and become effective when this has happened. In order to be able to save parameters, the user must be logged in to the device (see Chapter 7 "Log-in"). At the same time, the new parameters will be incorporated in the

#### **]** c:\ProgramData\Baumer DSL\DSL\_Parameter.txt log file.

The parameters shown inside the input mask can be stored in separate files by pressing write to file. With read from file stored parameters can be loaded back into the input mask.

#### 6.3.2 Register: Speed monitor

Figure 15: "Speed monitor" register

The Speed monitor register (Figure 15) shows the present speed curve as a function of time. The highest and lowest speed values that have occurred since the start of recording are marked respectively by a red line (maximum value) and a green line (minimum value). The ordinate scaling is made automatically to match the minimum and maximum that have been recorded.

Recording is stopped by operating the Pause button, and the graph is deleted by operating Clear graph. Changing to another register in the main window will also delete the speed curve.

#### 6.3.3 Register: Messages

	^	internal error?
Serial number: 123456		no error occurred
Device type: POG 10 DN 2500 I + SW Version: 0.12	DSL.R	no ciror occurred

last change:		Version 1.0.
Date: 03.12.2018		
Time: 16:15:08		Baumer Hübner Gmbl
User: Tester	~	©201

Figure 16: "Messages" register

The Messages register (Figure 16) shows the contents of the

log file **c:\ProgramData\Baumer DSL\DSL\_Parameter.txt** which is stored on the computer. The scroll bar can be used to scroll through the entire text.

If the warning symbol appears in the information window (see Chapter 6.1 "Information window"), the reason for the warning will also be displayed. Delete error can be used to remove the warning. The removal of a warning will also be noted in the log file, and requires a previous log-in (see Chapter 7 "Log-in").

A software reset inside the DSL will be executed by pressing the Reset DSL button.

# 7 Log-in

Before switching speeds can be programmed or errors can be deleted, a log-in is required. To do this, it is necessary to enter a user name (Figure 17).

This name is stored in the DSL and in the **c:\ProgramData\Baumer DSL\DSL\_Parameter.txt** log file. If the DSL is protected by a password, this password will also be requested.

After entering the user name and (if required) the password, the user can choose between Log-in and Log-in and new password.

a log-in is required for this function	
user name (max. 15 char) password (max. 8 char)	
login login and new password	
cancel	

If more characters are entered for the user name and password than the maximum number permitted (15 or 8 respectively), the string will automatically be cut off at the maximum length. Special characters may be used, and a distinction is made between capital (upper-case) and lower-case letters.

The device is delivered without password protection.

An incorrect password triggers an error message, and the log-in window remains open until either the correct password is entered or Cancel is operated.

If Log-in and new password is chosen, then a new entry template appears (Figure 18), with the request to enter the new password twice.

To cancel a password protection that has been entered, leave both fields empty.

If Cancel is operated in this template, then the user remains logged in to the device with the old password.

An alteration to a password is recorded in the c:\ProgramData\Baumer DSL\DSL\_Parameter.txt log file, but the password itself is not recorded here.

Please enter new password twice (max. 8 char)	
new password	
confirm password	
OK	
Carloor	

Figure 18: New password

# 8 Communication error

If the communication between the PC and DSL is faulty (for instance, because the connecting cable has been disconnected or the supply voltage was interrupted) then the following message will appear:

Baumer DSL Speed Switch GUI V1.0.1	
BaumerHübner	Motion Control
communication error	
reconnect	
	close program

Figure 19: Communication error

Use Reconnect to establish communication once more – a fresh log-in is not required.

In exceptional cases, the program will have to be stopped and then restarted.

# 9 Log file

When altered data (switching points, password ...) are saved in the DSL, an entry is made in the **c:\ProgramData\Baumer DSL\DSL\_Parameter.txt** log file.

Example: Entry for switching points

```
