

# Torque arm M6 stainless, length 120...130 mm ( $\geq 71$ mm)

Article number: 11072787

## Overview

- Torque arm for hollow shaft encoder
- Swivel joints size M6 according to DIN ISO 12240-4, size series K
- Compensate for mounting tolerances of the drive shaft in an axial direction
- Stainless version
- Length 120...130 mm
- Can be shortened to  $\geq 71$  mm

## Description

The hollow shaft of rotational speed measuring devices in the A4 design (such as hollow-shaft encoders) is pushed directly onto the drive shaft and frictionally locked to it. The reactive torque of the housing (break-away torque of the ball bearings, friction of bearings and seals, mass inertia) is then taken up by a torque arm. The swivel joints of torque arms in size 6 are conform to DIN ISO 12240-4, size series K, and are implemented as ball joints. This makes it possible for them to compensate the mounting tolerances of the drive shaft in an axial direction (e. g. as a result of thermal expansion of the shaft) and radial direction (e. g. as a result of runouts). Torque arms are available for a wide variety of applications, in standard, insulated and stainless steel versions. Definite length on request.
